Abstract: We discovered ...

1. Introduction

In this project we will solve the one-dimensional Poissson equation with Dirichlet boundary conditions by rewriting it as a set of linear equations and solving these numerically in a program written in C++. The equation to be solved is:

$$-u''(x) = f(x) x \in (0,1), u(0) = u(1) = 0 (1)$$

and we define the discretized approximation to u as v_i with grid points $x_i = ih$ in the interval from $x_0 = 0$ to $x_{n+1} = 1$. The step length or spacing is defined as h = 1/(n+1). We then have the boundary conditions $v_0 = v_{n+1} = 0$. We can approximate the second derivative of u with:

$$-\frac{v_{i+1} + v_{i-1} - 2v_i}{h^2} = f_i \quad \text{for } i = 1, \dots, n,$$
 (2)

where $f_i = f(x_i)$.

Eq. 2 can be written as a linear set of equations of the form:

$$\mathbf{A}\mathbf{v} = \tilde{\mathbf{b}} \tag{3}$$

where $\tilde{b}_i = h^2 f_i$ and **A** is an $n \times n$ matrix of the form:

$$\mathbf{A} = \begin{pmatrix} 2 & -1 & 0 & \dots & \dots & 0 \\ -1 & 2 & -1 & 0 & \dots & \dots \\ 0 & -1 & 2 & -1 & 0 & \dots \\ & \dots & \dots & \dots & \dots & \dots \\ 0 & \dots & & -1 & 2 & -1 \\ 0 & & & 0 & -1 & 2 \end{pmatrix}$$

(Show this!!)

We will assume that the source term is $f(x) = 100e^{-10x}$. Using the interval and boundary conditions as stated above, the above differential equation has a closed-form solution given by $u(x) = 1 - (1 - e^{-10})x - e^{-10x}$. We will compare our numerical solution with this result.

2. Solving the problem

2.1. Simple algorithm

In our case we are dealing with a simple tridiagonal matrix. We can therefore rewrite our matrix A in terms of one-dimensional vectors a, b, c of length 1:n. The linear equation then reads:

$$\mathbf{A} = \begin{pmatrix} b_1 & c_1 & 0 & \dots & \dots & \dots \\ a_2 & b_2 & c_2 & \dots & \dots & \dots \\ & a_3 & b_3 & c_3 & \dots & \dots \\ & \dots & \dots & \dots & \dots & \dots \\ & & & a_{n-2} & b_{n-1} & c_{n-1} \\ & & & & a_n & b_n \end{pmatrix} \begin{pmatrix} v_1 \\ v_2 \\ \dots \\ \dots \\ v_n \end{pmatrix} = \begin{pmatrix} b_1 \\ \tilde{b}_2 \\ \dots \\ \dots \\ \tilde{b}_n \end{pmatrix}.$$
(5)

which can be written as:

$$a_i v_{i-1} + b_i v_i + c_i v_{i+1} = \tilde{b}_i \tag{6}$$

for i = 1, 2, ..., n. The algorithm for solving this equation can be stated as follows:

(algorithm)

2.2. Using a library package

In addition to solving the linear second-order differential equation Eq. 1 using the simple algorithm described above, we want to solve the equation using Gaussian elimination and LU decomposition, then compare the results.

More coming here.
